

### Technical Sheet

#### What is it?

Energy and Sustainability Footprinting measures your current sustainability status and highlights areas of good practice and inefficiencies. It enables targeted improvements to be made to your energy and sustainability strategy, from operational control through to top management. This approach can be tailored to meet company or client requirements and best fill any gaps.

To assess and improve your sustainability status we can help you with:

- an energy and sustainability performance review and gap analysis;
- a benchmarking study which compares your position against current best practice standards;
- prioritising and implementing the necessary actions to achieve realistic targets.

#### Why do it?

Identifying potential areas for improvement will enable your business to:

- identify costs savings and efficiencies through improving processes, for example energy efficiency or waste recycling measures;
- attract, secure and retain business and improve your product/service quality through managing environmental risks and demonstrating good practice to clients;
- improve reputation, customer and employee satisfaction.

#### Our expertise

DPP has carried out energy and sustainability footprinting for a wide range of clients in the professional services, financial, manufacturing and defence sectors.

Our approach pinpoints priority areas for improvement to embed sustainability improvements into business culture to achieve wide reaching benefits.

We are able to provide Footprints at a strategic level for a business or to compare individual sites within a portfolio performed over a period of time to demonstrate improvement in practices.
